The Economic Impact of Climate-Related Natural Disasters

Mert Meriç Arslankoç

2026-10-26

Project Description

Climate-related natural disasters such as floods, storms, droughts, and wildfires can cause significant economic losses and threaten countries' sustainable development. This project aims to examine how economic losses caused by natural disasters change over time, which types of disasters cause the greatest damage, and how these losses differ in relation to countries' economic size. In addition, the relationship between countries' economic losses and their preparedness for climate change adaptation will be investigated, with attention to differences in climate vulnerability and preparedness levels. The project will examine why preparedness and resilience are important for reducing disaster risks and strengthening the capacity of countries and communities to recover after disasters. In line with Climate Action and Sustainable Cities and Communities, this project aims to raise awareness of the economic consequences of climate-related natural disasters and the importance of climate resilience.

Dataset 1

Dataset Name: Economic Costs of Natural Disasters

Data Source: Our World in Data

Data Link: https://ourworldindata.org/grapher/damage-costs-from-natural-disasters

Dataset 2

Dataset Name: Economic Damage by Type of Natural Disaster

Data Source: Our World in Data

Data Link: https://ourworldindata.org/grapher/economic-damage-from-natural-disasters

Dataset 3

Dataset Name: Economic Damage from Natural Disasters as a Share of Countries' Economic Output

Data Source: Our World in Data

Data Link: https://ourworldindata.org/grapher/natural-disasters-economic-damages

Dataset 4

Dataset Name: Climate Vulnerability and Readiness Data

Data Source: ND-GAIN Country Index

Data Link: https://gain.nd.edu/our-work/country-index/download-data/
