Carbon Emissions in Türkiye and the World

COP31 and Sustainable Development Goal 13

Efe Tan

October 26, 2026

Project Summary

Carbon dioxide (CO) emissions provide an important indicator for examining patterns related to climate change. This project will use country-level data from Our World in Data to visualize changes in Türkiye's per capita CO emissions and compare them with global averages and selected countries. Line charts and comparative visualizations will be used to identify long-term trends and differences across countries. The project relates these findings to Sustainable Development Goal 13 (Climate Action) and the broader climate policy context of COP31. By transforming numerical data into clear visual stories, the project aims to improve public understanding of climate issues and promote climate awareness.

Planned Data Sources

1. Our World in Data — CO2 Emissions per Capita

Dataset: https://ourworldindata.org/grapher/co-emissions-per-capita

CSV: https://ourworldindata.org/grapher/co-emissions-per-capita.csv?v=1&csvType=full&useColumnShortNames=false

This dataset provides annual per capita CO2 emissions by country and region, measured in tonnes per person. It will be used to compare Türkiye, the global average, and selected countries over time. The indicator covers CO2 emissions from fossil fuels and industrial processes, excluding land-use change.

2. United Nations — Sustainable Development Goal 13

Source: https://sdgs.un.org/goals/goal13

This source provides official information about climate action targets and supports the project's connection to SDG 13.

3. UNFCCC — COP31

Source: https://unfccc.int/cop31/about

This source provides official background information on COP31 and its relevance to international climate action.
