Project Summary: Regional Disparities in Germany's Carbon Footprint

As COP31 emphasizes the necessity of localized climate action (SDG 13), analyzing regional disparities in carbon footprints provides crucial insights for policy-making. This project focuses on Germany, visualizing greenhouse gas emissions across its 16 federal states (Bundesländer) to highlight the contrast between urban centers, where electric vehicle (EV) adoption is rising, and heavily industrialized regions relying on fossil fuels. Through spatial data visualization, I aim to illustrate how varying local economies and energy sources impact the national trajectory toward net-zero emissions.

Data Sources

- **Dataset:** State-level greenhouse gas emissions and energy consumption in Germany.
- **Provider:** German Environment Agency (Umweltbundesamt - UBA) and Federal Statistical Office (Destatis).
