Is Türkiye Drying Out?

Furkan ÇAKMAK

2026-10-25

Project Summary

Türkiye is located in the Mediterranean region, one of the areas most affected by climate change, and drought is becoming a serious risk for the country. However, rainfall in Türkiye changes a lot from year to year, which makes the long-term picture hard to see. In this project, I examine how drought in Türkiye has changed since 1950 and how it may change until 2100, using past climate data and future climate scenarios. The aim is to raise awareness about drought risk in Türkiye.

Data Sources

- **World Bank Climate Change Knowledge Portal (CCKP) – ERA5 Reanalysis:** Observed annual precipitation and mean temperature for Türkiye, 1950–2022.
