Urban Resilience and Sustainable Transportation: Evaluating Urban Air Quality and Mobility

Ramazan Sevindik

2026-10-25

Project Description

Rapid urbanization and heavy reliance on fossil-fuel vehicles significantly increase urban air pollution and greenhouse gas emissions, threatening sustainable city development. This project aims to examine the relationship between urban air quality, transportation networks, and city resilience across major metropolitan areas over time. By analyzing air pollution indexes alongside public transit infrastructure data, the project explores how sustainable municipal mobility policies can mitigate environmental degradation. Through this comprehensive analysis, the project highlights the critical role of urban resilience in building sustainable futures and protecting urban populations from climate risks.

Dataset 1

Dataset Name: Air Pollution Concentrations (PM2.5)
Data Source: Our World in Data
Data Link: https://ourworldindata.org/air-pollution

Dataset 2

Dataset Name: Urban Mobility and Transport Statistics
Data Source: World Bank Open Data
Data Link: https://data.worldbank.org/
