Electric Vehicles and Climate Action: From the Global Market to Türkiye

Semih Çelebi

2026-10-25

1. Project Summary

Road transport is one of the largest sources of greenhouse gas emissions, which makes the shift to electric vehicles (EVs) a key part of climate action under SDG 13. As COP31 takes place in Antalya, Türkiye, it is useful to see how far this shift has progressed worldwide and in the host country. This project compares EV sales across countries over time and examines how the carbon intensity of electricity changes the climate benefit of EVs. It also tracks the growth of public charging infrastructure in Türkiye. The main goal is to raise awareness about the role of electric mobility in meeting climate targets, in line with SDG 7 and SDG 13.

2. Data Sources

No.	Dataset	Data Provider	Data Source
1	New Electric Cars Sold (by country, yearly)	IEA	Our World in Data
2	Carbon Intensity of Electricity Generation	Ember	Our World in Data
3	Charging Service Market Statistics (Türkiye)	EPDK	EPDK (Energy Market Regulatory Authority)

Dataset Links:

3. Planned Approach

Time-series charts and maps will be used to compare countries, and a scatter plot will relate EV adoption to electricity carbon intensity. A Türkiye-focused chart will show the growth of charging sockets over time.
